```
Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Search time 43.8947 Seconds (without alignments) 6357.883 Million cell updates/sec

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention provides a male tissue-preferred regulatory region (1) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (1) into a plant where the exogenous gene impacts male fertility of the plant and (1) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The

of,

A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.

                                                                                                                                                                                                                                                                                                                                                                                   The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a Z. mays Ms45 promoter fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present sequence represents a DNA fragment -152 to -181 bases upstream the TATA box of a Z. mays Ms45 male-tissue preferred regulatory region

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably Ms45), which encodes a product selected from auxins, rolls and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile and infertile plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               M845; male; tissue-preferred; plant tissue; differentiated;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   08-JUN-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAH76332;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably Ms45), which encodes a product selected from auxins, rolB and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile and infertile plants
                                                                                                                                                                                                                 (PION-)
                                                                                                                                                                                                                                                                                                                                                                                      hybrid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                           The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a nucleic acid sequence encoding an Ms45 matissue preferred regulatory region from Z. mays
                                                                                                                                                                                                                                                                                       A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.
                                                                                     Sequence 1394 BP;

                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a DNA fragment -38 to -195 bases upstream of the TATA box of a Z. mays Ms45 male-tissue preferred regulatory region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 158

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated lung specific nucleic acid (CC (LSNA) comprising a sequence that: (a) encodes any of the 93 amino acid CC sequences comprising 17 - 733 amino acids, given in ABP52873 to ABP52865; CC (b) comprises any of 115 sequences comprising 148 - 3193 base pairs (bp), CC given in ABQ75262 to ABQ75376; (c) selectively hybridises to (a) or (b); CC or (d) has 60 % sequences identity to (a) or (b). LSNA and lung specific CC protein (LSP) sequences have cytostatic activity and can be used in gene CC therapy and vaccines. LSNAs and LSPs are useful for diagnosing and CC monitoring the presence and metastases of lung cancer in a patient. An CC antibody that specifically binds to an LSP can be used for determining CC with lung cancer, particularly by inducing an immune response against the CC lung cancer cell expressing the LSNAs or LSPs. In particular, these LSNAs CC and LSPs are useful for identifying, diagnosing, monitoring, staging, staging, CC imaging and treating lung cancer (e.g. squamous cell carcinoma) and non-cc cancerous disease states in lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that in methods of the invention. Note: The sequence data for this patent is methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid (CC encoding a polypeptide whose expression is inhibited by the antisense cCC nucleic acid; (2) a host cell containing the vector; (3) an isolated CC entrisense nucleic acid; (4) an antibody capable of specifically binding CC proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway of crequired for proliferation, or that inhibits cellular proliferation of the treative for cellular proliferation of the pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiocic; (10) profiling a compound to a compound acts; (9) manufacturing an antibiocic; (10) profiling a compound to a compound to a compound the control of the strains is present in a culture or collection of the strains; is present in a culture or collection of contentifying proteins or screening for homologous nucleic acids required contentifying proteins or screening for homologous nucleic acids required contentifying proteins or for screening homologous nucleic acids required contentify and the content content of the co
                                                                                drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, samotic stress or any of their combinations. The present sequence is the company of their combinations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New stress-responsive nucleic acid, useful responsiveness of a plant, e.g. cereal, to stress, salt stress or osmotic stress.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 2000 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 48;

Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, sants to an abiotic stress, such as cold stress, salts stress, osmotic stress or any of their combinations. The present sequence is the second of the present sequence is the second of the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plant; gene; ss; transcription; plant genome augmentation; cereal; soybean; alfalfa; sunflower; canola; cotton; peanut; tobacco; sugar beet, maize; barley; sorghum; rice; wheat; crop plant; insecticide resistance; stress tolerance; salt tolerance; cold tolerance; drought tolerance; plant; nutrition; apical dominance; dwarfism; early flowering; antiviral;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to plant nucleotide sequences that direct seed.

CC leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential

CC or constitutive transcription of an operatively linked nucleic acid

CC segment. The invention also relates to a method for augmenting a plant

CC genome and a method of identifying a gene, where its expression is

CC genome and a method of identifying a gene, where its expression is

CC altered in the seed, leaf, stem, panicle, pollen, root or is constitutive

CC in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower,

CC canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

CC canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

CC sorghum, rice or wheat. The polynucleotides and the polypeptides they

CC sorghum, rice or wheat the polynucleotides and the polypeptides they

CC sorghum, rice or wheat the polynucleotides and the polypeptides they

CC sorghum, rice or wheat to produce large quantities of foil or

CC sorghum, rice or wheat to produce large quantities or fungi, and to

CC proteins, to incur resistance to insecticides, viruses or fungi, and to

CC incur stress tolerance (e.g. salt, cold or drought) to ensure the plants

CC patent stress tolerance (e.g. salt, cold or drought) to ensure the plants

CC early flowering or altered metabolic pathways. This sequence are represents a

CC plant nucleic acid of the invention. Note: The sequence data for this

CC plant nucleic acid of the invention at sequence data for this

CC plant nucleic acid of the invention at sequence data for this

CC plant nucleic acid of the printed specification but was obtained in

CC patent did not form part of the printed specification but was obtained in

```
New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such stress, salt stress or osmotic stress.
                                                                                                                      as
```

Claim 48; SEQ ID NO 14082; 89pp; English.

The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the tresponsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention

Identifying at least pathogenic infection bacterial, fungal or gene expression. one gene involved in plant resistance or response for conferring resistance or tolerance to a plant viral infection by determining or detecting plant 6 6

27; SEQ ID NO 5386; 899pp; English

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered ij

WPI; 2003-248011/24

the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.

/note="Vector: pBrCNNASfiAB; The library was constructed from 11 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. CDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TNG_IISSUE=flowers environmental stress
